Full-time academic position at the Assistant/Associate Professor level (100% FTE-tenured) with an emphasis on molecular nutritional epidemiology in the Department of Public Health Sciences. Applicants must possess a M.D./MPH and/or a doctoral degree in a relevant field. Experience with population-based nutritional epidemiological research, particularly with interactive genetic and epigenetic effects in relation to early childhood neurodevelopmental disorders is necessary. The successful candidate should have a proven grant and publication track record in funded nutritional epidemiology and epigenetics research related to early childhood neurodevelopmental disorders, particularly autism spectrum disorder. Research experience as a principal investigator and/or extensive experience on funded projects documented by publications and other modes of disseminating research in areas related to nutritional epidemiology and epigenetics for appointment at the assistant or associate professor level is also necessary. The successful candidate should have experience teaching nutritional and molecular epidemiology. Responsibilities include development of an independent research program and teaching.

Please go to https://recruit.ucdavis.edu/applicants/apply/JPF00305 to submit your letter of application, CV, and names of five references. If you have any questions please contact Ms. Mary Wheeler by email (mkwheeler@phs.ucdavis.edu) or phone (530-752-3627). For full consideration, applications must be received by August 29, 2014. However, the position will remain open until filled through March 1, 2015.

The University of California, Davis is an affirmative action/equal opportunity employer.

Summaries of each research report provide added value and analysis of what the study means in practical terms. A scientific abstract and references for each research report assist in discerning useful takeaways.

The 2014 edition of The Best of Clinical Nutrition features studies on:
• Low vitamin D concentration exacerbates adult brain dysfunction
• Dietary fats and health: dietary recommendations in the context of scientific evidence
• Docosahexaenoic acid (DHA) supplementation and memory/reaction time in young adults
• Usefulness of fat and lean body mass index (BMI) reference curves in children and adolescents
• Amount of protein intake required for body weight loss and weight maintenance
• Fruit and vegetable intakes and lower risk of bladder cancer among women
